

OPERATING SYSTEM

(1)

L1

What is operating System?

- Interface between user and hardware.
- Software abstracting hardware
- Set of utilities to simplify application development / execution.
- Control program.
- Acts like a government.

Services of OS

- 1) User Interface
- 2) Program Execution **
- 3) I/O operation.
- 4) File-System Manipulation
- 5) Communication (Inter-process Communication).
- 6) Error Detection
- 7) Resource Allocation
- 8) Accounting.
- 9) Protection and security.

Goals of OS

- Convenience (user-friendly)
- Efficiency
- Portability.
- Reliability.
- Scalability.
- Robustness.

PARTS OF OS

Interface → 1) GUI 2) CLI
3) Batch Interface.

SYSTEM CALL

There are so many functions inside the kernel; to use those functions OS need to call those functions, so that it can run and perform some task; this call is called System Call.

A System call is a way for programs to interact with OS.

Protection in OS

all the process inside the must do their own operation; It should not affect other process or it should not do some other operation which is not permitted by the each process; to implement this OS gives protection the process: to implement this It is already give access to the process the operations already assigned to the process; other than those operation processes & will not

Cannot do other operation.

Dual mode of operation

↳ Is used to implement protection.

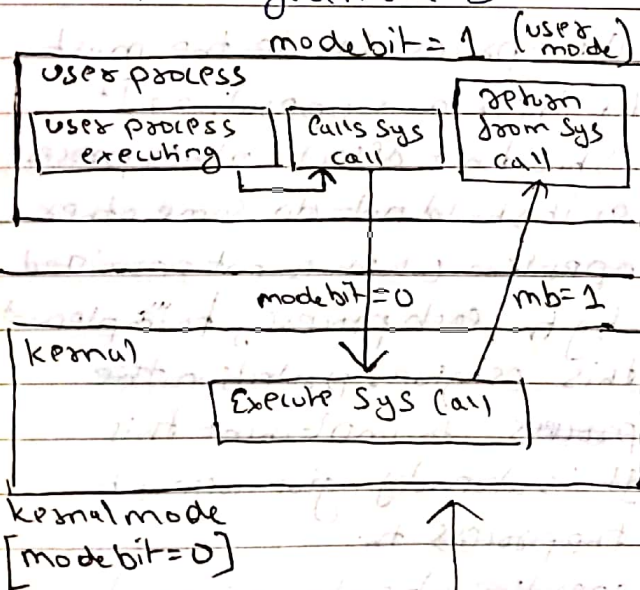

2 modes:

1) user mode (mode bit = 1)
When mode bit is 1 the process can do those operation only which are assigned to it.

If process need those operation which is not assigned to it, then it will ask OS to do that operation for the process. It is implemented by changing the mode bit to 0.

2) Kernel mode (mode bit = 0).

- System mode
- Supervisor mode
- Privileged mode

→ Transmission from user to kernel mode.

L-2

TYPES OF Operating System

1] Uni Programming OS

OS allow only one process to reside in main memory

- (RAM)
- Single process keep CPU and I/O Devices busy simultaneously.
 - Not a good CPU utilization.

OS
Process PI

2] Multi Programming OS

OS allow ~~only one~~ multiple processes to reside in MM

OS
P1
P2
P3
P4
P5
P6

- Better CPU utilization than uni programming.
 - Degree of multi-programming \Rightarrow no. of running progs (processes) in main memory.
- \Rightarrow Degree of multiprogramming $\Rightarrow 6$

- As the degree of multiprogramming increases CPU utilization is also increases, upto certain limit.

1] types of Multiprog. OS

- Pre-emptive
- Non Pre-emptive.

Non-pre-emptive →

- A process runs on CPU till its wish, it can leave the CPU or when → Either process terminates or goes for I/O operation
- forcefully no other process can take out these process out of the CPU

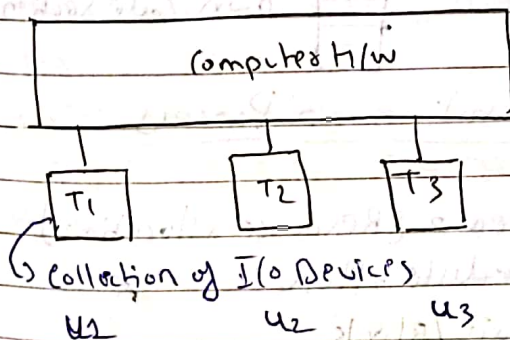

Pre-emptive → forcefully other process can take out these processes out of the CPU.

3] MULTI-TASKING OS

Extension of Multiprogramming OS in which processes execute in round-robin fashion

round robin $P_1 | P_2 | P_3 | P_4 | P_1 | P_2 | \dots$
all the processes execute in concurrently, not parallelly, it is also called time sharing OS.

4] Multi-User OS

This OS allows multiple users to access single system simultaneously

5] → Multiprocessing OS

This OS is used in computer systems with multiple CPUs.

TYPES →

1) Tightly Coupled
(shared-memory)

2) Loosely Coupled (Distributed System)

6] → EMBEDDED OS

An OS for embedded comp sys.

* Designed for a specific purpose, to increase functionality and reliability for achieving a specific task.

→ User interacting with OS is min.

7) Real Time OS

Real time OS are used in environment where a large no. of events mostly external to the comp sys, must be accepted and processed in a short time or within certain deadlines.

eg → for rocket launching.

→ Every process has a deadline

TYPES

↓
HARD RTOS

strict about
Deadline

↓
SOFT RTOS

Some relaxation
-tion in
Deadline.

8) HAND-HELD DEVICE OS

OS used in Hand held Devices
like Smartphones OS, which
work only on Smartphones.
